Summary

AI graduate with hands on experience in machine learning, computer vision, and OCR systems, combined with practical software development experience in a financial services environment. Skilled in building intelligent systems, developing responsive web interfaces, and designing data driven solutions. Strong foundation in Python, React.js, and model deployment concepts.

Experience

Software Developer — Alamalka (Stock Dealing Company) Oct 2025 – Present

- Developed an OCR solution to detect and extract customer information from ID card images, supporting the registration and implementation teams and reducing manual data entry.
- Contributed to the development of a C# desktop application designed to parse stock market TXT files, extract structured data, and export it into organized Excel sheets.
- Gained hands on experience in software development workflows, problem-solving, and building practical tools used in real business operations.
- Designed and implemented UI components for an internal React.js financial web application used by customers, managers, and stock operators.

Education

Arab Open University, Egypt, BS in Computer Science | **GPA: 3.2** Sept 2021 – June 2025

The Open University, United Kingdom, BS in Computer Science Sept 2021 – June 2025

Projects

EGX Pdf parser

- A web based operations analytics dashboard for the Egyptian capital market built with React on the frontend and Node.js/Express with SQL Server on the backend. The system automates the extraction of transaction data from daily stock market PDF reports, transforming unstructured documents into searchable and structured records. The application integrates REST APIs, automated PDF processing, advanced filtering, and data visualization to provide an efficient platform for monitoring and analyzing market operations.

Brainlytics

- An AI powered brain tumor detection web application built with HTML, CSS, and JavaScript on the frontend and Flask on the backend. The system integrates three deep learning models: a Keras/TensorFlow model to validate whether an uploaded image is a brain MRI scan, a Keras-based classifier to identify tumor types, and a PyTorch model for tumor segmentation. Users can select between classification and segmentation modes, while a custom Flask API handles image uploads, model inference, and structured result responses, enabling fast, interactive, and reliable analysis through a clean web interface

OCR extraction

- An ID card OCR web application built with HTML, CSS, and JavaScript for clear, and responsive UI, using YOLO for field detection and EasyOCR for text extraction. The system processes ID images, cleans and validates extracted text data, and structures key fields into organized datasets. Extracted information is displayed for user review and verification before being saved, supporting accurate data capture and consistency checks. Users can also download the verified data as an Excel file.

Skills

Programming Languages: Python, JavaScript, C#

Machine Learning & AI: TensorFlow, Keras, PyTorch, YOLO, Scikit-learn, Pandas, NumPy, Matplotlib, EasyOCR, Tesseract

Web Development: HTML, CSS, Bootstrap, React.js

Databases: SQL (Microsoft SQL Server / SSMS)

Tools & Version Control: Git, GitHub
